ABSTRACT

Alcohol driving is the leading cause of accidents so our projects is specifically provides alcohol detection using engine locking through Arduino incidents automatically.

INTRODUCTION

We usually come across drink and driving cases where drunk drivers crash their cars under the influence of alcohol causing damage to property and life. So, here we propose an innovative system to eliminate such cases, Our proposed system would be constantly monitoring the driver breath by placing it on the driver wheel or somewhere the drivers breath can be constantly monitored by it.

So if a driver is drunk and tries to drive the system detects alcohol presence in his/her breath and locks the engine so that the vehicle fails to start. In another case if the driver is not drunk while he starts the vehicle and engine is started but he/she drinks while driving the sensor still detects alcohol in his breath and stops the engine so that the car would not accelerate any further and driver can steer it to roadside.

FEATURES

•ADVANTAGES

- Low cost
- Automated Operation
- Low power consumption
- It provides an automatic safety system for cars and other vehicles as well

•APPLICATIONS

- Alcohol detector project can be used in the various vehicles for detecting whether the driver has consumed alcohol or not
- This project can also be used in various companies or organization to detect alcohol consumption of employees.

COMPONENTS USED:

- DC motor
- Arduino
- Mq3 sensor
- LCD

CONCLUSION

In this project we have developed a real time model that can automatically lock the engine when a drunken driver tries to drive a car. Now-a-days car accidents are mostly seen. By fitting this alcohol sensor into the car, we can save guard the life of the driver and also the remaining passengers. It is very simple application. The life time of the project is high. It has low or zero maintenance cost and of course low power consumption. This is a developed design to efficiently check drunken driving. By implementing this design a safe car journey is possible decreasing the accident rate due to drinking. By implementing this design, drunken drivers can be controlled so are the accidents due to drunken driving.

RESULTS

The sensor detects alcohol in the breath of the driver and stops the engine so that the car won't accelerate any further and steer it to roadside.

ACKNOWLEDGEMENT

We would like to thank our teacher Prof. Vinod Tirpude sir for helping us with this project. He allowed us to work on this project. Along with that, we would also like to thank our school principal Dr.F.B.Sayyad and HOD Dr.S.M.Khairnar wholeheartedly for giving this oppurtunity.We would like to thank our parents and friends who helped us in finalizing this project within a limited time frame.
